The efficiency of wind turbine depends on start up wind speed, rated wind speed and generator efficiency. Our vertical axis wind turbine could start up at 1.5m/s (3.4mph), has the power output to inverter at 2.5m/s and reach the rated power at 10m/s (22.3mph). The annual energy output is 40% more than wind turbine with a 3.5m/s or 4.5m/s cut in wind speed.

[The Truth About Small Wind Turbines - Solacity Inc.](#)

Since wind speed is the most important parameter for turbine energy production, getting that wrong has large consequences (the power in the wind goes with the cube of the wind speed, so double the wind speed and the power in it is  $2^3 = 2 \times 2 \times 2 = 8x$  as much). You have to be realistic about your annual average wind speed.

[Vertical-axis wind turbines: what makes them better ...](#)

While most wind turbines are configured for rotating about a horizontal axis, a relatively newer type of wind turbine—known as a vertical-axis wind turbine (VAWT)—is configured for rotating about a vertical axis. One advantage of this arrangement is that the wind turbine does not need to be pointed into the wind to be effective, which is an advantage on a site where the wind
